

# WorkSafe System®

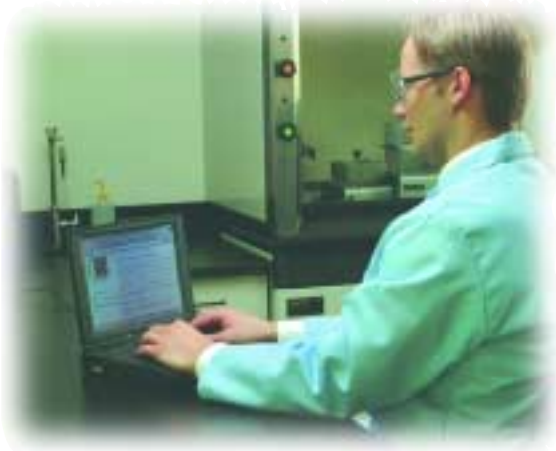

(internet-based environmental,  
health and safety software)

## **EHSmanager.com and Labconco Corporation — Partners in providing health and safety to your laboratory**

Labconco has partnered with EHSmanager.com to bring you WorkSafe System®, an internet-based environmental, health and safety software application. WorkSafe provides laboratories the means to effectively implement and manage their environmental, health and occupational initiatives. WorkSafe System allows you to protect laboratory workers while at the same time protect your operation from high insurance costs, regulatory fines and legal liability.

## **Advantages of the WorkSafe System®**

- Provides organizations with an inexpensive, easy-to-use software application that does not require extensive installation or hardware...an internet connection is all a company needs. Your computer hardware never needs upgrading and no corporate server space is used.
- WorkSafe System is fully supported by an experienced staff of environment, health and safety professionals that are continuously monitoring regulatory changes and keeping the system up-to-date.
- Provides a platform through which online training programs can be delivered, simply and cost effectively.
- Applies a hierarchy of security access to corporate managers, laboratory managers, supervisors and employees.

## **The WorkSafe System® – The Total Lab Solution**

- WorkSafe System can keep your programs, policies and procedures accessible to you and your employees. Since it is web-based, it can be accessed anywhere, anytime and is always current.
- WorkSafe System can implement your EHS program (for example, manage your own MSDSs on-line)
- WorkSafe System can satisfy many of your OSHA and EPA record-keeping and reporting needs.
- WorkSafe System can reduce your liability.
- WorkSafe System can lower your workers' compensation claims and rating.

Take for example the routine act of handling, pouring or using a chemical in the laboratory. The information accessible in the WorkSafe System can tell workers how to safely and environmentally consciously handle the chemical. WorkSafe can provide information about:

1. Step by step procedures.
2. Health effects that exposure could create.
3. The personal protective equipment that should be used.
4. The appropriate disposal or recycling procedures.
5. If an accident or near miss occurred, the ability to report this misfortune and protect fellow workers.

## **How Is WorkSafe® a System?**

The WorkSafe System contains many components that interact with each other. For example, when an organization or department inputs who they are and site specific information, all the written programs, policies, procedures, databases and paper forms appear with the organization name

in appropriate places within the text or headings.

The WorkSafe System integrates the specific regulations within the applicable programs, policies, and procedures contained in the System. This feature is available through the WorkSafe System's internet capabilities.

Many forms in the WorkSafe System enable you to enter data once into a single form. This information is then used throughout the system to complete similar data in other WorkSafe forms or drop-down lists. For example, after step 3 of "getting started" is completed all the job names and tasks appear as drop down menus throughout the System. This information is dynamic, meaning it changes and updates these lists as your organization changes and updates these job names and tasks.

Another example of WorkSafe's interactive components are the Chemical Database and Material Safety Data Sheets (MSDS) that are available on the internet. The Chemical database has the capability to inventory chemical products by department and associate links from your organization's products in the Chemical database with corresponding MSDSs on the internet.

Finally, the system allows multiple users to access different components of the system based on your company's preferences.
